### Detailed Action

1. Applicant's arguments, with respect to claims 1, 6, 11, 16, 17 and 21 have been fully considered and are persuasive. The rejection of 1-25 has been withdrawn, hence claims 1-25 are allowed.

### Allowance

2. The following is an examiner's statement of reasons for allowance:

In reference to claims 1, 6, 11, 16 and 21: National LM2637 datasheet teaches an integrated circuit for monitoring and controlling multiple power outputs from a power supply (ATX not shown) that generates a primary power voltage ( $V_{CC}$ ), and one more secondary power voltage ( $V_{DD}$ ) derived from the primary power voltage (see National LM2637 Fig. 2, and page 8-9 application information). National LM2637 has an input means for receiving the primary and secondary power voltages from the power supply (see Pin Description in page 8). The integrated circuit has a means for controlling the primary and secondary power voltages to generate controlled voltage power outputs (see National LM2637 page 8, pin 16-20, and overview first paragraph).

In page 2 of National LM2637, the integrated circuit consists of threshold variables ( $V_{CC-TH1}$  and  $V_{CC-TH2}$ ) with corresponding limit values for the

primary power source. The threshold variables and the limiting values constitute a means for sensing when the primary power voltage reaches or exceeds a threshold reference level. Further, the National LM2637 also has a means for delaying connection of the primary and secondary power voltages to the controlled voltage power outputs for selected delay time (see page 8, theory of operation, start up, first paragraph).

However, unlike the claimed invention, the soft start in National LM2637 ramps up until the error amplifier reaches a predetermined cycle, then the soft start session ends where the output level of the amplifier is released and allowed to go to a value that is determined by the feedback loop.

Where as, the claimed invention includes all the features noted above and provides a means to initiate the soft start after the delay has occurred. Further, the claimed invention includes a means delaying connection of the primary and secondary power voltages to the controlled voltage power outputs for selected delay time after the first primary voltage reaches the reference threshold level.

Citation of pertinent prior art:

- Kelly (IEEE Article, 'A Soft Starting AC Voltage Regulator') teaches a method of detecting shut of voltage and brings the system to a desirable full operation voltage level.

The remaining claims are dependent upon claims 1, 6, 11, 16 and 21 and contain further limitations.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
